

CLAIMS

1. Method of producing a steel starter head shaft (10) that comprises successively at least one first front guidance length (T1) sliding axially on a starter head, a second fluted intermediate length (T2) comprising external flutes (16) able to cooperate with complementary internal flutes on the starter head, and a third rear length (T3) comprising at least one annular shoulder transverse face (22) oriented towards the front, which constitutes a rear stop face for determining a determined axial position of the starter head, the method comprising at least the following successive steps:

- a) machining the three first, second and third lengths (T1, T2, T3);
- b) producing the external flutes (16) of the second intermediate length (T2);
- c) surface heat treatment of at least an axial part (P1) of the starter head shaft (10);

characterised in that the method includes an additional step, prior to the heat treatment step, for reducing the residual mechanical stresses resulting from the steps prior to the heat treatment.

2. Method according to the preceding claim, characterised in that the said additional step is a step of annealing at least an axial portion (18-22, T3) of the starter head shaft (10).

3. Method according to the preceding claim,

characterised in that the additional step of annealing at least an axial portion (18-22, T3) of the starter head shaft (10) is an operation of surface heating by induction along the said axial portion.

4. Method according to the preceding claim, characterised in that the additional step of annealing by surface heating by induction comprises a heating period during which the inductor is axially static with respect to the said portion of the starter head shaft (10).

5. Method according to the preceding claim, characterised in that the static heating period is between 0.5 seconds and 15 seconds.

6. Method according to claim 4, characterised in that the axial length (L) of the inductor (30) is substantially equal to the axial length of the said portion of the starter head shaft (10).

7. Method according to claim 3, characterised in that the axial length (L) of the inductor is less than the axial length of the said portion of the starter head shaft (10), and the inductor is driven in axial translation with respect to the starter head shaft (10).

8. Method according to the preceding claim, characterised in that the relative axial translation speed of the inductor with respect to the starter head shaft (10) is between 100 mm/minute and 700 mm/minute.

9. Method according to claim 3, characterised in that the induction heating power is less than 10 kW.

10. Method according to claim 3, characterised in that the starter head shaft (10) is driven in rotation with respect to the inductor at a rotation speed of less than 200 rev/min.

11. Method according to claim 6, characterised in that the internal profile of the inductor is complementary to the external profile of the said starter head shaft (10) portion.

12. Method according to claim 2, characterised in that the said additional step of annealing at least an axial portion (18-22, T3) of the starter head shaft (10) is an operation of heating the starter head shaft in a furnace.

13. Method according to the preceding claim, characterised in that the heating temperature is between 500°C and 700°C.

14. Method according to claim 12, characterised in that the duration of the operation of heating the starter head shaft (10) is between 30 minutes and 120 minutes.

15. Method according to claim 12, characterised in that the operation of heating the starter head shaft (10) in a furnace is an operation of heating at a constant temperature.

16. Method according to claim 12, characterised in that the operation of heating the starter head shaft (10) in a furnace is followed by an operation of slow cooling to ambient temperature.

17. Method according to claim 1, characterised in that

the said step c) of surface heat treatment of at least an axial part (P1, P2) of the starter head shaft (10) is a step of surface hardening by induction.

18. Method according to the preceding claim taken in combination with claim 3, characterised in that the said additional steps of surface heating by induction and surface hardening by induction are carried out successively with the same induction heating means.

19. Method according to claim 1, characterised in that the method comprises a step, subsequent to the surface heat treatment step, of mechanical straightening of at least an axial part of the starter head shaft (10).

20. Method according to claim 1, characterised in that the method comprises a step of planing certain portions (12, 21) of the surface of the starter head shaft (10) that is subsequent to the step of surface heat treatment of at least an axial part (P1, P2) of the starter head shaft.

21. Method according to claim 1, characterised in that the said annular shoulder transverse face (22) oriented towards the front of the third rear portion of the starter head shaft (10) belongs to an internal radial groove (18) that receives a rear elastic stop ring for determining the said determined axial position of the starter head.

22. Method according to claim 1, characterised in that the starter head shaft (10) is extended axially beyond the said third rear length (T3) in order to constitute the shaft (T4) of the rotor of the electric motor of the

starter.

23. Method according to the preceding claim,
characterised in that the rotor shaft comprises a knurled
(20) length (T4) produced by cold deformation, and in
that the said additional step for reducing the residual
mechanical stresses is subsequent to the step of
production of the knurled length of the rotor shaft by
cold deformation.
